TITLE OF INVENTION

**"SIGNALLING SYSTEM IN A SIGNALLING POINT"**

APPLICANT(S) FOR DO/EO/US

**Klaus GRADISCHNIG**

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

- 1. ☒ This is a **FIRST** submission of items concerning a filing under 35 U.S.C. 371.
  - 2. ☐ This is a **SECOND** or **SUBSEQUENT** submission of items concerning a filing under 35 U.S.C. 371.
  - 3. ☒ This express request to begin national examination procedures (35 U.S.C. 371(f)) at any time rather than delay.
  - 4. ☒ A proper Demand for International Preliminary Examination was made by the 19th month from the earliest claimed priority date.
  - 5. ☒ A copy of International Application as filed (35 U.S.C. 371(c)(2))
    - a. ☒ is transmitted herewith (required only if not transmitted by the International Bureau).
    - b. ☐ has been transmitted by the International Bureau.
    - c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US)
  - 6. ☒ A translation of the International Application into English (35 U.S.C. 371(c)(2)).
  - 7. ☒ Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 5371(c)(3))
    - a. ☐ are transmitted herewith (required only if not transmitted by the International Bureau).
    - b. ☐ have been transmitted by the International Bureau.
    - c. ☐ have not been made; however, the time limit for making such amendments has NOT expired.
    - d. ☒ have not been made and will not be made.
  - 8. ☐ A translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)).
  - 9. ☒ An oath or declaration of the inventor(s) (35 U.S.C. 371(c)(4)).
  - 10. ☒ A translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371(c)(5)).
- Items 11. to 16. below concern other document(s) or information included:
- 11. ☒ An Information Disclosure Statement under 37 C.F.R. 1.97 and 1.98; (PTO 1449, Prior Art, Search Report).
  - 12. ☒ An assignment document for recording. A separate cover sheet in compliance with 37 C.F.R. 3.28 and 3.31 is included.  
(SEE ATTACHED ENVELOPE)
  - 13. ☒ A **FIRST** preliminary amendment.
    - ☐ A **SECOND** or **SUBSEQUENT** preliminary amendment.
  - 14. ☐ A substitute specification.
  - 15. ☐ A change of power of attorney and/or address letter.
  - 16. ☒ Other items or information:
    - a. ☒ Submittal of Drawings
    - b. ☒ **EXPRESS MAIL #EJ 077703907US**, dated October 23, 2000.

Although other modifications and changes may be suggested by those skilled in the art, it is the intention of the inventors to embody within the patent warranted hereon all changes and modifications as reasonably and properly come within the scope of their contribution to the art.--.

## **IN THE CLAIMS**

On substitute page 6, line 1, change "New Patent Claims" to --I Claim:--.

Amend claim 1 as follows:

1. (Amended) [Signalling means] A signalling apparatus for processing  
2 signalling messages, comprising  
-- links via which the signalling [means] apparatus is connected to other  
4 signalling [means] apparatus.  
-- at least one signalling system that sends signalling messages to the other  
6 signal [means] apparatus or, respectively, receives signalling messages  
from the other signalling apparatus [these] via said links,  
8 [characterized by]  
-- [a] said signalling system that respectively allocates a signalling network  
10 identity to said links [a link];  
-- at least one of said links that is returned in a loop from [the] a signalling  
12 point to the [same] signalling point[, what is referred to] as a loop link,  
[whereby] different signalling network identities being [are] allocated to  
14 the loop link at [the] an output and input side by the signalling system.

- 2.(Amended) [Signalling means] A signalling apparatus according to  
2 claim 1, [characterized in that] wherein said signalling system, with [the]  
assistance of a said loop link[,] communicates signalling messages between two  
4 other signalling systems contained in the signalling [means] to which is  
respectively provided [comprises] an interface.

- 3.(Amended) [Signalling means] A signalling apparatus according to  
2 claim 1, [characterized in that] wherein said signalling system generates internal  
load for test purposes with [the] assistance of [at least one] said loop link.

4.(Amended) [Signalling means] A signalling apparatus according to  
2 claim 1, wherein [characterized in that] said signalling system realizes an  
interworking [Internetworking /sic/] communication with other networks with  
4 [the] assistance of a said loop link.

5.(Amended) [Signalling means] A signalling apparatus according to [one  
2 of the claims] claim 1 [through 4], wherein [characterized in that] said signalling  
system is a signalling system according to No. 7 and allocates [the] a same  
4 network identifier [(NI)] to said loop link at the output and input side.

6.(Amended) [Method] A method for signalling in a signalling means,  
2 comprising the steps of: [in accord wherewith]  
-- [a signalling system of the signalling means allocates] allocating signalling  
4 network identities to [the] links of [the] a signalling [means] apparatus by  
a signalling system;  
6 -- [the signalling system allocates] allocating different signalling network  
identities at [the] an output and input side to a link[, what is referred to] as  
8 [the] a loop link[,] that is returned from the signalling apparatus [means] to  
[the] a same signalling means in a loop.

7.(Amended) [Method] A method according to claim 6, further comprising  
2 the steps of: employing [characterized in that a] said loop link [is employed] by  
said signalling system [in order] to communicate signalling messages between  
4 two further signalling systems of the signalling means having [to which it  
comprises] a respective interface.

8.(Amended) [Method] A method according to claim 6, further comprising  
2 the step of: employing [characterized in that a] said loop link [is employed] by  
said signalling system to generate load for test purposes.

9.(Amended) [Method] A method according to claim 6, further comprising  
2 the steps of: employing [characterized in that a] said loop link [is employed] by  
said signalling [in order] to enable [a desired Internetworking [sic]] with other  
4 networks [for a network].

10.(Amended) [Method] A method according to [one of the claims] claim  
2 6 [through 9], further comprising the steps of: [characterized in that a common NI  
is allocated] to [a] said loop link at [the] an output and input side by said  
4 signalling system.

#### **IN THE ABSTRACT**

Delete lines 2 and 8.

#### **REMARKS**

The foregoing amendments to the specification and claims under Article  
41 of the Patent Cooperation Treaty place the application into a form for  
prosecution before the U.S. Patent and Trademark Office under 35 U.S.C. §371.

Accordingly, entry of these amendments before examination on the merits is hereby requested.

Respectfully submitted,

A handwritten signature in black ink, appearing to read 'Melvin A. Robinson', written over the printed name.

## SIGNALLING SYSTEM IN A SIGNALLING POINT

In channel-related signalling systems, for example in the signalling system R5, it is possible that a signalling point communicates or, respectively, sets up a connection with itself via a payload channel loop. This is not possible in the signalling system ZGS7 (see below). However, such loops are advantageous for solving a number of problems. For the interworking of different signalling systems, it is a critical simplification in the realization when all signalling systems interwork with a selected signalling system and not each with each. Further, such loops are advantageous in order to be able to test systems with high traffic. Finally, monitors can be attached to such loops. Different traffic flows can then be supplied for observation on the basis of purely administrative measures (without hardware re-strapping).

In ZGS7, a signalling point is identified by an address, what is referred to as the signalling point code. The level 3 of the message transfer parts cannot send a message to its own signalling point code or, respectively, cannot receive a message from itself. Certain users of the message transfer part, for example TUP and ISUP, can also normally not send channel-related messages to themselves, even if the message transfer part were to enable this. In order to nonetheless enable such loops, specific methods have been implemented that are essentially comprised therein that specific signalling channels form loops on which destination and/or sender address are inverted/complemented. Similar, user-specific modifications must be potentially implemented for users.

The invention is based on the object or enabling loop formation without said disadvantages.

This object is achieved by a system according to claim 1.

The invention is explained in greater detail below with the assistance of the drawing, whereby the drawing comprises six Figures.

In ZGS7, a network is identified by what is referred to as a network indicator (NI) that is contained in the messages. 2 bits for the NI are reserved in the messages; up to four networks can thus be distinguished from one another in a node

(said networks can, for example, be a matter of the signalling networks of communication networks of different operators or different technologies (for example, broadband or narrowband) as well as a matter of national or, respectively, international signalling networks). Since a signalling link normally belongs to only one network, however, the perception has prevailed that allocating individual links to specific networks suffices for distinguishing the network. The NI is thus no longer required as a distinguishing feature.

In fact, there are communication systems that support more than four signalling networks (for example, 8 or 32), for example the EWSD system of Siemens AG, or such systems are being planned. A network identity is thereby internally allocated to each signalling link and an NI is externally allocated to each internal network identity. Networks with different internal identity can thereby definitely use the same external NI. Each (internal) network is thereby completely separated from the other networks.

This concept, what is referred to as the multiple network concept, is then employed for operating loops in ZGS7 without requiring additional development. The signalling system in a signalling point is identified in two (internal) networks by different point codes. These two networks can then be unproblematically connected to one another by signalling links. When a check of the incoming NI for correctness is implemented in the system or, respectively, in at least one of the two networks to be interworked with one another, then the same external NI must also be allocated to the two internal networks. Note: when there is no mapping of incoming linkset onto NI and different networks must be monitored by a single, shared network entity (protocol realization), the NI therefor must be taken to identify the "responsible" network (the applicable routing table). Without a check, for example, it is thereby possible that a message from one network is illegally forwarded into another network due to the employment of an incorrect NI, which can lead to disadvantageous behavior in the other network (this could be referred to as *uncontrolled* tunneling since it is externally triggered and can no longer be controlled in the node).

Said arrangement is referred to below as network or, respectively, signalling tunnel. Embodiments of the invention are explained in greater detail below.

Figure 1 shows an embodiment of the invention for the interworking in a  
5 signalling point.

An ISUP is located both in the internal network 1 as well as 2. Externally, the two networks use the same NI but different point codes. A call between R1 and R2 is routed via the ISUP loop. It suffices for this purpose to correspondingly  
10 configure the ZGS7 routing tables in both networks as well as the routing tables for the call processing (R1 and R2 in ISUP) and to accomplish [sic] the necessary trunks and signalling tunnels for the ISUP loop.

An interworking is realized between CCITT signalling system R1 and ISUP as well as between CCITT signalling system R2 and ISUP but not between R1 and R2. A call that is supposed to run from R1 to R2 is first handed over outgoing to  
15 the ISUP by the call processing, said ISUP routing the MSU belonging to this connection setup via the signalling tunnel to the ISUP of the other network. Coming from R1, thus, the call is thus first handed over to the ISUP in network 1. Using the called party address signalled by R1, the ISUP determines the next destination with the appertaining DPC (DPC=9), enters this DPC into the MSUs and then hands over  
20 these MSUs to the MTP of ZGS7. The MTP takes the DPC from the MSUs and, on the basis of its routing table for network 1, determines the link (a loop link) therefrom via which it further-routes the MSU. The ISUP in network 2 receives the MSUs from the MTP and in turn hands over the MSUs and, thus, the call to the call processing. On the basis of its routing table, the call processing then determines that the call is  
25 forwarded via R2.

Figure 2 shows an embodiment of the invention for the load generation.

Figure 3 shows routing tables in the point codes X, 1 and 3 belonging to the embodiment in Figure 2, i.e. in the different networks of the signalling point supported by the system.

For example, 6 networks are established in the system and cyclically  
30 connected to one another by network tunnels. Two networks (networks 2 and 3 here)

are also connected to a protocol test device that emulates a point code (X and Y here) in each of the two networks. All networks employ the same NI.

These routing tables in the networks in the system are configured such that network 3 routes MSUs that contain a destination point code  $PC=X$  to network 4, and network 4 routes them farther to network 5, etc. The routing tables are analogously configured in the opposite direction for  $PC=Y$ . A message generated by the test device is thus routed through the system six times, as a result whereof high system loads can be generated with relatively simple test devices. Further variations of this application are the incorporation of the users (for example, ISUP) or, on the other hand, completely closed loops wherein MSUs constantly circulate.

Figure 4 shows an embodiment of the invention for the interworking in combined broadband and narrowband systems.

The SSNC is the shared MTP platform in the EWSD broadband node. B-ISUP is located only in the EWSX part, N-ISUP in the EWSD and EWSX. In order to enable an NNI (trunk) interworking in the EWSD broadband node bet. broadband and narrowband without additional development, the interworking between N-ISUP in the EWSD and N-ISUP in the system EWSX can be achieved by the described signalling tunnel.

Figure 5 shows an embodiment of the invention wherein an operator (for example, D1) offers inter-network STP services to a number of other network operators (for example, D2, E+, E2). This exemplary embodiment can be employed for certain practically relevant expressions of the incoming linkset/DPC screening (see Q.706, §8).

D1 should thereby be able to interwork with all other networks, D2 with D1 and E+, E+ with D1 and D2, and E2 only with D1. This function can be solved [sic] with a plurality of internal networks connected by tunnels. A separate internal network is thereby allocated to the links to a respective network operator. The individual networks are connected by tunnels in conformity with the allowed signalling relationships. The routing tables in the individual networks are configured in conformity with the allowed relationships.

Alternatively, the traffic between the networks can also be routed via an internal transition network (see the example from Figure 1). This has the advantage that fewer tunnels are potentially required. On the other hand, traffic between the networks then gotta go through two tunnels. [!!!!!!!] It is thereby probable in this embodiment that the internal networks are based on a common external address space, i.e. that there's really only one network externally. In our example, this network would be what is referred to as the network interworking. Seen from the outside, the different internal networks look like separate STP connected to one another according to the rules.

10                Figure 6 shows routing tables belonging to the embodiment in Figure 5.

              These routing tables in the four logical internal networks of the signalling point show allowed primary and, potentially, secondary routes to the respectively other networks, whereby these routes are identified by the respectively next point code. The row marked with D2 in the first table, for example, thereby symbolically stands for all destinations (point codes) in D2 that are allowed to be selected

15                proceeding from D1. The direct link(set) to  $P_c=b$  is thereby taken as primary route. If this link(set) happens to have failed, the route via  $P_c=c$  can be taken as secondary route since a route to D2 is also present therefrom. The "external" routes, for example from  $P_c=a$  into the D1 network, are not recited here since they're not relevant.

20                The explained embodiments of the invention have shown that an existing mechanism ("multiple networks") can be employed without additional outlay for a number of applications as a result of the inventive configuration.

**New Patent Claims**

1. Signalling means for processing signalling messages, comprising

-- links via which the signalling means is connected to other signalling means,

5 -- at least one signalling system that sends signalling messages to other signal means or, respectively, receives signalling messages from these via said links,

characterized by

-- a signalling system that respectively allocates a signalling network identity to a link;

-- at least one link that is returned in a loop from the signalling point to the same signalling point, what is referred to as a loop link, whereby different signalling network identities are allocated to the loop link at the output and input side by the signalling system.

15 2. Signalling means according to claim 1, characterized in that said signalling system, with the assistance of a said loop link, communicates signalling messages between two other signalling systems contained in the signalling means to which is respectively comprises an interface.

3. Signalling means according to claim 1, characterized in that said signalling system  
20 generates internal load for test purposes with the assistance of at least one said loop link.

4. Signalling means according to claim 1, characterized in that said signalling system realizes an Internetworking [sic] with other networks with the assistance of a said loop link.

25 5. Signalling means according to one of the claims 1 through 4, characterized in that said signalling system is a signalling system according to No. 7 and allocates the same network identifier (NI) to said loop link at the output and input side.

6. Method for signalling in a signalling means, in accord wherewith

- a signalling system of the signalling means allocates signalling network identities to the links of the signalling means;
- the signalling system allocates different signalling network identities at the output and input side to a link, what is referred to as the loop link, that is returned from the signalling means to the same signalling means in a loop.

5

7. Method according to claim 6, characterized in that a said loop link is employed by said signalling system in order to communicate signalling messages between two further signalling systems of the signalling means to which it comprises a respective interface.

10

8. Method according to claim 6, characterized in that a said loop link is employed by said signalling system to generate load for test purposes.

9. Method according to claim 6, characterized in that a said loop link is employed by said signalling in order to enable a desired Internetworking [sic] with other networks for a network.

15

10. Method according to one of the claims 6 through 9, characterized in that a common NI is allocated to a said loop link at the output and input side by said signalling system.

## Abstract

### Signalling System in a Signalling Point

- Loops via which a signalling point communicates with itself are advantageous for solving various problems. According to the invention, a loop is
- 5 enabled by a link that is returned in a loop from a signalling point to the same signalling point and to which two different signalling network identities are allocated at the output and input side.

Ich bestätige hiermit, dass ich den Inhalt der obigen  
Patentanmeldung einschliesslich der Ansprüche  
durchgesehen und verstanden habe, die eventuell  
durch einen Zusatzantrag wie oben erwähnt abgeän-  
dert wurde.

I hereby state that I have reviewed and understand the  
contents of the above identified specification,  
including the claims as amended by any amendment  
referred to above.

Ich erkenne meine Pflicht zur Offenbarung irgendwel-  
cher Informationen, die für die Prüfung der vorliegen-  
den Anmeldung in Einklang mit Absatz 37, Bundes-  
gesetzbuch, Paragraph 1.56(a) von Wichtigkeit sind,  
an

I acknowledge the duty to disclose information which  
is material to the examination of this application in  
accordance with Title 37, Code of Federal  
Regulations, §1 56(a).

Ich beanspruche hiermit ausländische Prioritätsvor-  
teile gemäss Abschnitt 35 der Zivilprozessordnung der  
Vereinigten Staaten, Paragraph 119 aller unten ange-  
gebenen Auslandsanmeldungen für ein Patent oder  
eine Erfindersurkunde, und habe auch alle Auslands-  
anmeldungen für ein Patent oder eine Erfindersurkun-  
de nachstehend gekennzeichnet, die ein Anmelde-  
datum haben, das vor dem Anmeldedatum der  
Anmeldung liegt, für die Priorität beansprucht wird.

I hereby claim foreign priority benefits under Title 35,  
United States Code, §119 of any foreign application(s)  
for patent or inventor's certificate listed below and  
have also identified below any foreign application for  
patent or inventor's certificate having a filing date  
before that of the application on which priority is  
claimed.

Ich beanspruche hiermit gemäss Absatz 35 der Zivilprozessordnung der Vereinigten Staaten, Paragraph 120, den Vorzug aller unten aufgeführten Anmeldungen und falls der Gegenstand aus jedem Anspruch dieser Anmeldung nicht in einer früheren amerikanischen Patentanmeldung laut dem ersten Paragraphen des Absatzes 35 der Zivilprozessordnung der Vereinigten Staaten, Paragraph 122 offenbart ist, erkenne ich gemäss Absatz 37, Bundesgesetzbuch, Paragraph 1.56(a) meine Pflicht zur Offenbarung von Informationen an, die zwischen dem Anmeldedatum der früheren Anmeldung und dem nationalen oder PCT internationalen Anmeldedatum dieser Anmeldung bekannt geworden sind.

I hereby claim the benefit under Title 35, United States Code, §120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, §122, I acknowledge the duty to disclose material information as defined in Title 37, Code of Federal Regulations, §156(a) which occurred between the filing date of the prior application and the national or PCT international filing date of this application.

Ich erkläre hiermit, dass alle von mir in der vorliegenden Erklärung gemachten Angaben nach meinem besten Wissen und Gewissen der vollen Wahrheit entsprechen, und dass ich diese eidesstattliche Erklärung in Kenntnis dessen abgebe, dass wissentlich und vorsätzlich falsche Angaben gemäss Paragraph 1001, Absatz 18 der Zivilprozessordnung der Vereinigten Staaten von Amerika mit Geldstrafe belegt und/oder Gefängnis bestraft werden können, und dass derartig wissentlich und vorsätzlich falsche Angaben die Gültigkeit der vorliegenden Patentanmeldung oder eines darauf erteilten Patentes gefährden können.

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true, and further that these statements were made with the knowledge that wilful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such wilful false statements may jeopardize the validity of the application of any patent issued thereon.
